Title: Toward Standardized Equity Measurement in the Clean Energy Industry

Abstract: The last few years have seen a call for increased diversity, equity, and inclusion (DEI) across nearly every walk of life, and clean energy is no exception. In this presentation, we will introduce a proposal to develop an “off the shelf” guide to equity measurement that will make it easier, faster, and less costly for stakeholders to assess equity in their programs and will allow for industry-wide comparisons and identification of best practices. We will describe the preparatory work completed this fall, including key findings from review of the state of equity analysis within and outside the clean energy industry, and the first iteration of a plan to engage diverse stakeholders in a process to develop an equity measurement framework that is itself equitable and inclusive.
